Table of contents

Preface i

1. Introduction 1
   - 1.1 General 1
   - 1.2 Objectives 2
   - 1.3 Abbreviations and symbols 3
   - 1.4 Glossary 3

2. Durability design in accordance with the *fib* MC2010 provisions 9
   - 2.1 Introduction 9
   - 2.2 *fib* MC2010 general and durability design methodology 9
   - 2.3 Application of *fib* MC2010 methodology to durability design 10
   - 2.4 Basis of the full probabilistic approach and limit states 12
   - 2.5 Procedure for durability design – Verification using the full probabilistic format 13
     - 2.5.1 Introduction 13
     - 2.5.2 Collection and establishment of data for the verification 15
   - 2.6 Verification of design service life 20
     - 2.6.1 Material characteristics 20
     - 2.6.2 Limit State Function (LSF) verification 20
     - 2.6.3 Recalculation / redesign 21
     - 2.6.4 Final design report 22
   - 2.7 Summary 22

3. Durability models of *fib* MC2010: Analysis and their sensitivity to variation of the input parameters 24
   - 3.1 Introduction 24
   - 3.2 Carbonation model 25
     - 3.2.1 Model description and parameter definition / analysis 25
     - 3.2.2 Carbonation model - definition of parameters & guidance for use 27
     - 3.2.3 Sensitivity of carbonation model results to variations in the value of the model input parameters when using deterministic, partial-safety factor (semi-probabilistic) and probabilistic methods 31
     - 3.2.4 Summary – Carbonation model 38

3.3 Chloride ingress model 39
3.3.1 Introduction 39
3.3.2 Model description and parameter definition / analysis 39
3.3.3 Sensitivity of the model results to input parameter variations 42
3.3.4 Sensitivity of chloride model results to variations in the value of the model input parameters when using deterministic, partial-safety factor (semi-probabilistic) and probabilistic methods 50
3.3.5 Summary – Chloride model 59
4. Examples of calculations for carbonation and chloride ingress. Case studies validation 63
4.1 Introduction 63
4.2 Benchmarking parameter values and results 63
4.2.1 Carbonation – Influences on design calculation for cover thickness 63
4.2.2 Carbonation - FORM calculation of sensitivity 65
4.2.3 Chloride ingress - Influences on design calculation for cover thickness 65
4.2.4 Chloride ingress - FORM calculation of sensitivity 66
4.3 Example calculations – Case study: Bridge columns and deck 67
4.3.1 Introduction to chloride ingress design illustration 67
4.3.2 Column durability design 68
4.3.3 Bridge deck durability design 71
5. Concluding remarks 74
6. Future development needs 76
6.1 Introduction 76
6.2 Some uncertainties associated with contemporary models and of their probabilistic treatment 76
6.3 Examples of research and development needs 77
6.3.1 Physical meaning of input parameters 77
6.3.2 Mathematical uncertainties 77
6.4 Summary of research and development needs 79
7. Bibliography 81
Annex A. Corrosion propagation modelling 85
A.1 Introduction 85
A.2 Structural consequences of corrosion 85
A.3 Background on the corrosion propagation phase in *fib* MC-SLD (Bulletin 34) and *fib* MC2010 87

A.4 Quantification of the corrosion propagation period 89
A.4.1 Introduction 89
A.4.2 Weather-dependent corrosion rate 90
A.4.3 Ranges of instantaneous corrosion rates 96
A.4.4 Calculation of the corrosion rate V_{corr} 98
A.5 Statistical considerations relating to the depassivation step 99
A.6 Initial phases of corrosion-induced cracking of concrete 100
A.7 Limit states of depassivation and initial deterioration (condition limit states) 102
A.7.1 Introduction 102
A.7.2 Depassivation limit state calculation 105
A.7.3 Condition / Deterioration Limit State calculation 105
Annex B. Overview of service life design provisions in the *fib* Model Codes 108
B.1 Introduction 108
B.2 *fib* Model Code for Service Life Design (*fib* MC-SLD) 108
B.2.1 Introduction 108
B.2.2 Contents of *fib* MC-SLD 109
B.2.3 Design options and approaches given in *fib* MC-SLD 110
B.2.4 Components of *fib* MC-SLD 112
B.2.5 Principal steps in the service-life design approach to the calculation of resistance to environmental loads 116
B.2.6 Deterioration models employed in *fib* MC-SLD 118
B.2.7 *fib* MC-SLD focus upon uncracked concrete - Influence of cracked concrete 122
B2.8 Concluding comments 123
B.3 *fib* Model Code 2010 123
B.3.1 Introduction 123
B.3.2 Contents of *fib* Model Code 2010 (*fib* MC2010) 123
B.3.3 Components of *fib* Model Code 2010 123
B.3.4 Durability related provisions of *fib* Model Code 2010 127
B.3.5 Through-life care and conservation of concrete structures 133
