Foreword	i
List of symbols	iv
Scope	1
1. The behaviour of the composite section	5
1.1 Introduction	5
1.1.1 Normal stresses	8
1.1.2 Shear stresses	10
1.1.3 Torsion	11
1.1.4 Interactions of different stress components in the same cross section	11
1.2 Section under axial and eccentric force	11
1.2.1 General hypotheses.	12
1.2.3 Ductility	19
1.2.4 Resistant capacity of composite sections under normal stresses	25
1.3 Section under shear force	35
1.4 Section under torsion moment	38
1.5 References	41
1.6 Further reading	42
2. Composite structural systems and shear connection	43
2.1 Description and conceptual motivations	43
2.2 Full and partial interaction	45
2.3 Shear connection in steel-concrete composite beams	48
2.3.1 Common devices	48
2.3.2 Innovative connectors	50
2.3.3 Analytical models for shear connection	51
2.4 Full and partial connection	52
2.4.1 Bending capacity and shear connection	53
2.4.2 Interface slip demand	54
2.5 Simplified sectional formulation including partial shear interaction	56
2.5.1 Generalised moment-curvature relationship	56
2.5.2 Graphical representation of the generalised moment curvature relationship	57
2.6 Behaviour of shear connections under cyclic actions	61
2.7 References	63

3.	Instability of structural members	65
3.1	Introduction	65
3.2	Steel columns	70
3.3	Concrete columns	73
3.4	Composite columns	81
3.5	Final considerations	84
3.6	References	86
4.	Creep and shrinkage effects in composite elements	87
4.1	Introduction	87
4.2.1	Development of modulus of elasticity and strength with time	88
4.2	Outline of time-dependent effects in concrete	88
4.2.2	Creep and shrinkage	89
4.3	Creep and shrinkage effects in composite girders	94
4.3.1	General overview	94
4.4	Structural analysis accounting for time-dependent effects	104
4.4.1	General step-by-step procedure	104
4.4.2	Algebraic methods	106
4.4.3	Accuracy of the algebraic methods applied to evaluate creep effects in composite beams	109
4.4.4	Modular ratio method for practical design	111
4.4.5	Example of application of the modular ratio method	112
4.5	References	115
5.	Structural analysis	117
5.1	General aspects	117
5.2	Beams	118
5.2.1	Non-linear analysis	119
5.2.2	Linear analysis	122
5.2.3	Plastic analysis	125
5.3	Frames	126
5.3.1	Mechanical and geometrical idealisation	126
5.3.2	No sway frames	127
5.3.3	Sway frames	127
5.3.4	Second order effect	128
5.3.5	Elastic analysis including partial interaction	130
5.3.6	Connections between members	135
5.4	References	137

6.	Fire design of composite structures	138
6.1	Introduction	138
6.2	Thermal flux on structural members	138
6.3	Thermo-mechanical analysis of structures subjected to fire	139
6.3.1	Type of analysis and solution methods	140
6.3.2	Thermal properties of the structural materials	140
6.3.3	Mechanical properties of the structural materials	142
6.4	Fire resistance of composite members	146
6.4.1	Composite beams and slabs	146
6.5	Fire analysis of composite structures	154
6.6	Appendix: Applications and comparisons on composite columns	156
6.6.1	Application of the general procedure to concrete filled composite columns	156
6.6.2	Comparison between fire resistance of different types of columns	159
6.7	References	161
